

## **Abstract of the Disclosure**

An adjustable hinge-frame arrangement, especially for folding arrangements with a hinge (5) having two hinge leaves (6), which can be swiveled relative to one another over gudgeons (7) and a hinge pin (8), each hinge leaf (6) being connected with a frame (3) of a door or window element (2) or the like, is constructed pursuant to the invention so that each hinge leaf (6) has an integral molding (9), with which it engages a corresponding recess (10) of the side surface (11) of the respective frame (3), which recess is formed with clearance in such a manner with respect to the integral molding (9), that the side surface (11) of the frame (3) and the hinge leaf (6) can be tilted with respect to one another and the hinge leaf (6) has locking means, with which the different angular positions between the side surface (11) of the frame (3) and the hinge leaf (6) can be fixed detachably. Preferably, the recess (10) of the side surface (11) of the frame (3) has undercuts (18), by means of which the integral molding (9) is held in the form of a rocker.
